

## **SE3VR11 Virtual Reality Prof Richard Mitchell**

### **Perception and Technology**

In Virtual Reality we create an imaginary world to inhabit

Important to understand how humans perceive 'worlds'

Covers Visual, Auditory and Haptic senses

The notes for this course have been developed over many years by many people. My thanks to

Max Parfitt, Faustina Hwang, Andrew Dunk, and Adrian Haffegge

p1 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## **Introduction**

PMS has defined VR, introduced some terminology, covered some of the history and applications

He has listed the 4 key elements (Sherman & Craig, 2003)

A Virtual Environment (world)

Immersion

Sensory feedback

Interactivity

And the Components of a VR System.

Input and Output Devices

VR Engines

Databases

p2 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## **Virtual Reality and Games**

Many are interested in computer games ...

Often these games portray a world visually and auditory

They have controllers which allow exploration of the world and interaction with the world and others there

To an extent they are Virtual Reality, but

A flight simulator game at home is ok,

But not the same as using a real flight simulator

(with hydraulically operated mockup of a cockpit)

But Headsets are increasingly available for video games

p3 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## **Games driving VR**

In 2016, \$5.1billion will be spent on VR gaming

<http://fortune.com/2016/01/05/virtual-reality-game-industry-to-generate-billions/>

Not surprising therefore that the games industry has helped considerably re VR development

As such, for the individual part of the coursework, you will all use the Unity software <https://unity3d.com/5>

Good for making simple worlds, with inbuilt physical modelling, interaction, movement and exploration

For more detailed models, other software is better

So in Groups make more complex worlds - individuals in groups can focus on other packages.

p4 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## **Focus of My Lectures**

I shall focus on how a VR world can be produced

Note Technology provides only a model of the world Sufficient to 'fool' our senses

This requires an understanding of how we perceive

Hence I look at the senses first then the technology

First, however, how can we quantify VR?

This relates to some of the four key elements..

Then I justify why we need to know of 'Human Factors'

p5 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## **Quantifying VR**

What makes one VR experience better than another?

Graphical realism? Frame rate? A good storyline?

How can you describe what's good or bad about VR to someone?

Common terms are: Presence and Immersion.

Used to describe physiological and psychological integration of a subject when using a virtual reality system.

But...

p6 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Immersion and Presence

As loosely defined as "Virtual Reality"

Most common definitions are:

Immersion refers to technological sophistication  
e.g.: 'a measure of ... the [VR] system's capacity to reproduce the physical sensation of the real world'  
(S. Bouchard 2009)

Presence refers to a mental state  
e.g.: 'the physical feeling of being in a place other than the physical location that the user finds him/herself in.'

(T. Sheridan 1996)

p7 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Determinants of Immersion

How well the VR technology delivers aspects of the VE to the user; measurable and comparable between systems

| Determinant of Immersion | Description  |
|--------------------------|--|
| Sensory Channels         | No. different kinds of sensory stimuli produced by the system  |
| Field of Regard          | Directions in 3D from which a stimulus can originate (sound could come from any direction; touch could occur anywhere on body) |
| Fidelity                 | The quality of the displays, resolution etc.   |
| Correspondance           | How closely user's movements match corresponding environment changes, view position, hand movements etc                        |

p8 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Determinants of Presence

How well user feels as though they are a participant within the environment

| Determinant of Presence | Description  |
|-------------------------|--|
| Interaction             | The ease and extent of available interaction   |
| Duration                | The length of exposure to a simulation   |
| Self representation     | The user's ability to see their own body and actions   |
| Consistency             | The uniformity of sensory information. The position something is seen should match the position it is felt |
| Behaviour               | The realism of objects' behaviour in the environment   |

p9 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Distracters and Breaks in Presence

What reduces presence and immersion ...

Distracters are stimuli which seem out of place and remind the user they are not really part of the simulation

A 'Break in Presence' according to Mel Slater\* occurs when the user stops responding to virtual stimuli and starts noticing real stimuli.

Examples:

Screen flicker, unrealistic/unexpected VE behaviour, sickness, loud noise etc.

(Interesting psychological research on haptics in VR)

\*M. Slater, "Presence and the Sixth Sense,," Presence: Teleoperators & Virtual Environments, vol. 11, pp. 435-440, 2002.

p10 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Faithfulness and Believability

An alternative way of classifying VR experience.

More appropriate for describing design of VR systems

Faithfulness:

Refers to how accurately a simulator recreates real world stimuli.

Similar to the definition of immersion as technological sophistication

Believability:

Refers to user experience and psychological state. A Believable VR simulator is not necessarily "faithful"

Similar to most definitions of Presence.

p11 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Why Study Human Factors?

"To adequately create the illusion of reality we must understand both the sensory process and the inference process"

- S. Aukstakalnis

"Designing or selecting a graphics display cannot be done meaningfully without first understanding the human visual system. An effective graphics display needs to match its image characteristics to those of the user's ability to view the synthetic scene."

- Burdea & Coiffet

p12 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Why Study Human Factors?

i.e. Virtual Reality is about working out where you can cheat.  
To create a believable Virtual Reality you must first understand how the senses perceive reality.  
This sets minimum technological requirements  
Also sets upper thresholds which need not be exceeded  
We will look at what actually happens  
Then consider the technology that is suitable

p13 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Sensory Perception - Some Jargon

Cue Theory:

A theory [there are others] of how complex concepts are inferred from sensory stimuli

In summary, cue theory states: 'Humans learn to make connections between key events in the sensory information streams (cues) and real world phenomena'

You will hear VR people using the term 'cues' a lot

Useful way of thinking about what form feedback should take in VR

p14 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## More Jargon

Primary and Secondary Qualities:

Primary Qualities can be perceived by many senses.  
Position is visual, audible and tactile

Secondary Qualities are unique to a single sense  
Red is unique to vision as bitterness is unique to taste

Primary qualities can be more difficult as different sensory displays must agree or conflict can arise

p15 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Physiology of the Visual System

We are visually aware of objects in the world by the way in which they absorb, reflect and scatter different wavelengths of light

The eye converts light in the visible spectrum of frequencies (380-750nm) into neural impulses which can then be processed by the brain

The pattern of light which falls on the retina is called the retinal image.

The photoreceptors convert the retinal image into what is known as a neural image which is then sent on to be converted into edges, textures and objects.

p16 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

p17 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Projection

Of binocular field of view onto two retinas and onto optic tracks

National Center for Biotechnology Information: NCBI  
» Bookshelf » Neuroscience » Sensation and Sensory Processing » Central Visual Pathways » The Retinotopic Representation of the Visual Field

## Two Photoreceptors - Rods & Cones

Rods:

Most sensitive to lower light levels

More numerous - 120million Vs 6.5m cones

Only one "Colour"

Best at motion detection (great flicker sensitivity) mainly in peripheral vision, no rods in foveal region

Cones:

Three kinds (usually) VERY roughly most sensitive to one of red, green and blue wavelengths

Get much higher priority on the neural image (more of the optic nerve)

Concentrated at the fovea

p18 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## The Eye and Response

Eye has Two kinds of photoreceptors: Rods & Cones

p19 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## The Human Visual System

NCBI » Bookshelf » Neuroscience » Sensation and Sensory Processing » Vision: The Eye »

p20 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Visual Performance Characteristics

Smallest resolvable separation in a pattern is approx 0.0083° of visual angle (about 167dpi at 1m )

Field of view:

for one eye = 150° horizontally and 120° vertically;  
for two eyes = 180° horizontally and 120° vertically

Flicker fusion occurs around 60Hz for most people,  
maximum sensitivity at 10Hz

The perfect visual display will at least exceed these.

p21 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Limitations

Blind spot -

Cover your right eye. Hold the paper at arm's length.

With your left eye, keep looking at the + while you slowly bring the image closer.

At a certain distance, the dot will disappear - the dot is on the blind spot of your retina.

Try with the left eye

p22 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## What do you really see?

The one thing we don't see is what's actually there

We interpret the world via very limited sensory organs

Approx a colour by summing narrow bandwidth 'notches'

Miss a huge part of the electromagnetic spectrum

Merge discrete images into continuous motion

Almost no absolute measurement of depth (more later)

Use many assumptions based on expected/learnt phenomena

Optical illusions show where these assumption break down:

<http://www.georgemather.com/MotionDemos/BreathingQT.html>

But, this turns out to be useful to exploit in VR design

p23 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Psychology of the Visual System

Visual perception includes: colour, form, pattern  
recognition, motion and depth

Depth and motion are more difficult

there are no (almost) specific receptors for depth so  
it must be inferred (prone to error)

Depth and motion closely linked

p24 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Psychology of the Visual System

Position of an object is found from:

Relative direction from observer (egocentric direction)

Distance from observer

Direction is easy, retina is a topographical map of the scene so brain simply maps 2D retinal coordinates to 2D angular coordinates

Depth is harder, no absolute method - have to guess

Whole books written about the psychology of vision,

we'll concentrate on one very small part, very relevant to VR and computer graphics - depth perception

p25 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Depth Perception - The Ames Room

p26 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## How it Works

[https://en.wikipedia.org/wiki/Ames\\_room](https://en.wikipedia.org/wiki/Ames_room)

Used in Lord of the Rings films

Good explanation/demonstration:

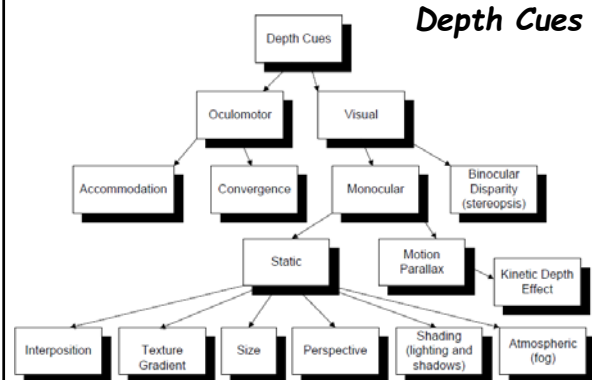

<http://www.youtube.com/watch?v=Ttd0VjXF0no>

p27 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Depth Cues

p28 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Depth Cues - Oculomotor

The closest to an absolute measure of depth

Kinaesthetic in origin,

We move our eyes, using muscles

Information from muscles to brain give depth cues

Accommodation: how much the ciliary muscles are pulling on the crystalline lens to focus the image

(almost useless as a depth cue)

Convergence: the orientation of the eyes,

i.e. the closer an object the more the eyes rotate towards each other.

p29 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Figures

<http://ucalgary.ca/pip369/mod4/depthperception/oculomotor>

p30 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Depth Cues - Static, Monocular

### Interposition:

When one object partially obscures another  
Simple but strong, will override most others

### Size:

Expected depth can also affect perceived size

### Linear perspective/Texture Gradient

Both closely linked  
Parallel lines converge as they get farther away  
Horizontal lines get closer

p31 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Depth Cues - Static, Monocular

### Shading:

Includes Lighting and Shadowing

### Atmospheric

Distant objects become less clear  
- air pollution, fog etc.  
(also bluer - used by artists)

Shadows - give relative position between objects

p32 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Depth Cues - Stereopsis (seeing solid)

### Retinal Disparity

Each eye gets a slightly different view  
Brain fuses images together to create 'solid' objects  
Less effective with distance

<http://cmp.felk.cvut.cz/demos/Stereo/New/Matching/cedar-right.png>

p33 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Depth Cues - Dynamic

### Motion Parallax

When objects or the viewer are in motion, closer objects move faster across the retina than those farther away

When a single eye moves approx the distance between the eyes (60-70mm) the depth cue is equivalent to binocular disparity

This effect is quickly lost when scene stops moving

p34 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Kinetic Depth

### Kinetic Depth effect (Similar to parallax)

Objects can seem 3D when moving and 2D when stationary.

Think of a glass sphere with dots painted on it.

<http://www.youtube.com/watch?v=XGfMB76U5ts>

<http://www.georgemather.com/MotionDemos/KDEQT.html>

These are examples of the human mind attempting to make sense of the world from limited and incomplete sensory input

p35 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Motion Perception

Motion is a very Primary quality\* - it can be perceived visually, audibly, tactilely, through smell and even balance. In the real world objects move smoothly and continuously.

In the virtual world (and cinema, TV etc) they 'jump'

For all the senses a threshold exists where two successive stimuli are perceived as one continuous stimulus

For vision this is known as flicker fusion ~17ms\*

For audition this is known as flutter fusion ~10ms\*

For touch this is known as vibration and is around 5ms\*

\* Fraisse, P., Time And Rhythm Perception, in Handbook Of Perception. 1978, Academic Press. p. 203-247.

p36 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Motion Perception - Apparent Motion

BUT fusion is not necessary for motion to occur,  
it is preferable though

Apparent Motion occurs when the time delay between  
successive stimuli is lower than the fusion threshold  
but the brain still perceives motion

Lots of varieties: Short range, long range,  
transformational, biological

Some of these effects work for touch and sound too.

Examples here:

<http://www.georgemather.com/MotionMP4.html>

p37 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Summary Questions

1. A VR interface is to be designed to train jet fighter pilots. There is some debate as to whether the interface should have stereoscopic 3D vision. What are some of the arguments for and against in terms of depth perception and the pilots actions?
2. Many TVs are now being sold as '3D Ready'. Why might it be said that all TVs are 3D?

**IMPORTANT:** These questions are NOT compulsory and are NOT part of the course mark. They are for you to test your understanding of the lecture material.

p38 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Visual Display Technologies

Most displays can be categorised as:

- Desktop
- Wearable
- Projection

Most of the 3D cues from last lecture are part of the  
2D image, stereoscopy needs dedicated hardware

Generating most good 3D cues therefore a  
software/rendering problem

Why We might refer to any TV or monitor as "3D  
ready"

Common stereo techniques discussed next, others exist

p39 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Stereoscopic Display Techniques

A different image must be presented to each eye

If both eyes viewing same display surface need to  
selectively block or transmit light

Most single surface displays have some ghosting (crosstalk)  
when one eye sees parts of image intended for other

Can cause discomfort, loss of presence / stereo fusion

In practice single display systems are rarely completely  
free from ghosting

Three main varieties: active, passive and autostereoscopic

p40 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Active Stereo

Left/Right image are  
alternated on display surface.  
LCD 'shutter' glasses block  
each eye alternately

CrystalEyes 3, StereoGraphics

p41 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

Ghosting affected by:  
Display fade time  
Light blocked by LCD  
Synchronisation of glasses  
and display

## Passive Stereo - Polarisation

Many passive stereo techniques  
Polarisation and Frequency  
Multiplexing most common

Viewer wears glasses : each  
lens allows only one direction  
of polarised light to pass

Display transmits each L/R  
image with diff orientation  
of light polarisation

<http://www.mineralatlas.com/Optical%20crystallography/properties%20of%20light.htm>

p42 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## On Polarisation

Linear polarisation:

- Cheaper/easier to manufacture with high % light absorption/transmission
- User can't rotate head

Circular Polarisation

- Often more ghosting
- Invariant of viewer orientation
- Display surface must preserve polarisation (usually requires special coating)

p43 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Passive Stereo-Frequency Multiplexing

Frequency Multiplexing -

Old style Anaglyph, newer Infitec.

Block diff parts of spectrum

Invariant of head rotation.

Anaglyph loses colour info.

Infitec can preserve colour if

intensities correctly adjusted

Any display surface can be used

p44 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Autostereoscopic Displays

Don't use glasses

lenses/barriers make sure each eye sees a different part of the display

[http://dti3d.com/About/dti\\_technology.htm](http://dti3d.com/About/dti_technology.htm)

p45 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Autostereoscopic - Fixed Barriers

Have a limited viewing angle and 'sweet spots'

Can sometimes allow multiple viewing positions

(look around) by trading off resolution

Don't scale well, better for small displays

p46 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## AS - fixed lenses/barriers

From www.3dforums.com

p47 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## AS - Movable Barriers

To increase viewing angle : track user's eye position and adjust barrier to match

Get 'look around' effect

Only one viewer at a time

p48 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Comparing Visual Displays

Lots of criteria for selecting/comparing performance:

Technological:

- Field of View/Field of Regard
- Resolution
- Update Rate
- Interface with tracking methods
- Associability with other sense displays - i.e. integration with audio and haptic displays

continued

p49 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Continued

Ergonomic:

- User mobility
- Environment requirements
- Throughput - the number of people who can experience the VE in a given time.
- Safety
- Encumbrance

Lots of others:

- Portability
- Cost

p50 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Desktop displays

Cheap, common, accessible  
Small FoV/FoR  
Use all the stereo techniques discussed

Linear Polarised:

<http://www.planar3d.com/>

Circular Polarised  
(Row Interlaced):

<http://www.zalman.co.kr>

Shutter Glasses:

<http://www.midia.com>

Autostereoscopic:

<http://www.seereal.com/>

<http://www.panoramitech.com>

p51 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Wearable Displays

Just considering head mounted. Also have boom mounted and hand held.

More expensive than desktop, especially for high quality (£10k++)

OculusRift may change this!

Separate display for each eye

Optics magnify image and change focal length (1-5m)

Resolution generally low

Usually limited field of view <60°

Trade off FoV ↔ Resolution

Excellent (complete?) Field of Regard

Visette 45, Cybermind

p52 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Wearable Displays

Real world normally blocked from view

Weight & comfort a big issue

Low latency tracking essential.

Can't see own body

Balance and movement affected

Unnatural body positions often adopted

Distance travelled often underestimated by up to 25%, unclear why

p53 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Head Mounted Display

A simplified model of the optics (from [www.vrtechnology.org](http://www.vrtechnology.org))

p54 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Projection Displays

One or more projectors or screens  
 Large area - good field of View  
 2D or Stereo (Linear, Circular or Infitec most common)  
 Usually rear projected to prevent users' shadows  
 Can see own body - good for presence and natural movement/interaction  
 Multiple users can share environment (configurations can affect this i.e. head tracking)  
 Different configurations in use:  
 Panoramic, Vision Domes, Spheres, Power Walls

p55 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
 © Prof Richard Mitchell 2016

## Panoramic Displays

i-Cone, Fraunhofer IMK

p56 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
 © Prof Richard Mitchell 2016

## Vision Domes

<http://www.avrrc.lboro.ac.uk>

<http://www.cg.tuwien.ac.at>

p57 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
 © Prof Richard Mitchell 2016

## Spheres

Cybersphere

<http://www.vr-systems.ndtilda.co.uk/sphere1.htm>

p58 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
 © Prof Richard Mitchell 2016

p59 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
 © Prof Richard Mitchell 2016

## Cubic Displays

p60 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
 © Prof Richard Mitchell 2016

## Computer Assisted Virtual Environment

Or CAVE Assisted Virtual Environment  
Has 3 to 6 large screens  
Puts user in a room for visual immersion  
Usually driven by a one or more powerful graphics engines  
Can put equipment into room to aid realism  
Eg shopping trolley in model of supermarket  
Can have multiple people

p61 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Advantages of CAVE

Provides high resolution and large FOV  
Uses peripheral vision  
Use pair of light weight shutter glasses for stereo viewing  
User has freedom to move about the device  
Has space to place props (cockpit etc.)  
Environment is not evasive  
Real and virtual objects can be mixed  
A group of people can inhabit the space

p62 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Disadvantages

Very expensive (approximately 1 million dollars)  
Requires a large amount of physical space  
Projector calibration must be maintained  
Only 1-2 users can be head tracked  
Stereo viewing can be problematic  
Physical objects can get in the way of graphical objects

p63 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Projection Displays - Issues

Multiple projectors must have:  
Geometric continuity  
(correct alignment)  
Photometric continuity  
(consistent brightness and colour)

p64 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Wall Displays

To keep resolution high, multiple projectors usually tiled  
Continuity particularly important  
Where images overlap, need to adjust brightness  
Can adjust brightness in software or hardware  
(blend plates)

p65 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

### Summary

Providing a good visual representation of a virtual world is important

There are numerous technological solutions

It is an active area of work

As is shown by the 2016 Consumer Electronics Show, where VR features - see

<http://www.bbc.co.uk/news/technology-35192737>

Next week we start to consider hearing virtual worlds

p68 RJM 14/1/16

SE3VR11 - Virtual Reality - Part A  
© Prof Richard Mitchell 2016

## Auditory Perception

We have explored the ways in which virtual worlds can be displayed  
Now we consider how they can be heard  
Again we look at how we perceive the real world this time hearing it  
And then look at the technologies to allow us to hear virtually.

p1 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Transmission of sound

Sound travels as a pressure wave through any medium dense enough to sustain it.

Speed related to medium's density  
(340m/s in air at sea level)  
Intensity drops off with distance  
(Inverse Square Law)  
Intensity loss related frequency<sup>2</sup>  
High Freq attenuate more

Like light, sound is 'coloured' when reflected, absorbed or passed through objects

p2 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B

## Transmission of sound

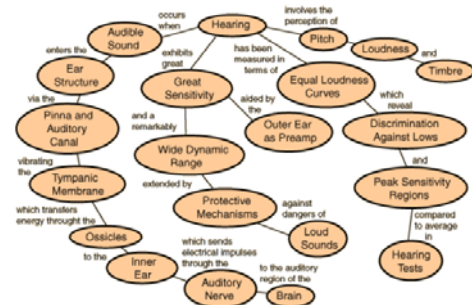

See <http://hyperphysics.phy-astr.gsu.edu/>

p3 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## The Ear

<http://hyperphysics.phy-astr.gsu.edu/hbase/sound/hearcon.html>

p4 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Human Auditory System

Converts mechanical sound energy into neural impulses  
Outer ear (Pinna) acts like a radar dish, focusing energy from large area to a small point (auditory canal)  
The auditory canal acts as a closed tube resonator: selective freq amplification (~2-5KHz, speaking range)  
The middle ear transmits pressure waves to the Cochlea  
Inside the Cochlea is the Basilar Membrane  
Covered in 15000+ tiny hairs, bent by soundwaves  
These trigger electrochemical impulses  
Somehow brain actually converts these to meaningful info (various theories)

p5 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## The Ear

p6 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Logarithms and Sound

We hear sound over wide ranges of freq : 20Hz to 20kHz  
Info from 20..200Hz as important as that 200..Hz  
So use log scale ... same space when go from  $f$  to  $f \cdot 2$

Just like piano keyboard ... octave is from  $f$  to  $2 \cdot f$

<http://www.reading.ac.uk/~shsmchlr/jsfreqresp/AudioSignals.html>

Sound power also large range ..  $20 \log_{10}(V)$  is V in dB

p7 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Auditory Performance

Typical young humans perceive signals 20Hz-20KHz

The band 500Hz-2KHz is particularly sensitive

Human hearing has continuous & complete Field of Regard  
(sound can be heard from any direction)

Building blocks of sound perception : pitch and loudness

Perception of Pitch ~ logarithmic with frequency

Loudness also logarithmic with amplitude

but affected by other factors including:

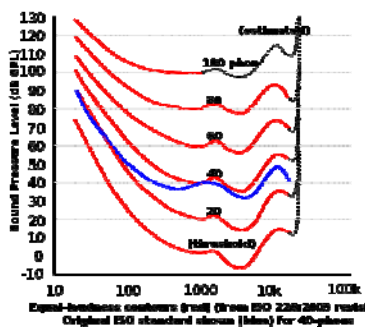

duration, previous stimuli, attention and frequency  
(equal loudness contours)

p8 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Equal-loudness\_contour

Measure of sound  
for diff freqs  
where listener  
perceives constant  
loudness (unit phon)

[http://en.wikipedia.org/wiki/Equal-loudness\\_contour](http://en.wikipedia.org/wiki/Equal-loudness_contour)

p9 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Auditory Perception

Eye has a 2D array (retina), but ears have two points

Yet we distinguish and separate many different  
simultaneous sounds

'Cocktail Party Effect' - can focus on partic sound  
even when many other noises

The most powerful cues for this come from grouping  
sounds by location

Localisation : judging position of sound source in 3D

Requires both direction and distance information.

p10 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Spatial Hearing

We locate sound sources based on:

- azimuth cues - position left right
- elevation cues - position up down
- range cues - distance away

reverberation and echoes  
(and knowledge of the world)

Broad spectrum sounds (many freqs) much easier

carry more info and relate to more auditory cues

Often v. diff to identify direction of single, const freq

p11 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Localisation -Time Cues

Sound travels at a constant speed.

If not equidistant to both ears, reach one ear first.

Called Inter-aural Time  
Difference (ITD)

A sound arriving from  
the side will be delayed  
by 600-800µs

A human can perceive  
delays down to 10-20µs

p12 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Localisation - Time Cues

For a continuous, non-varying sound the time of arrival at each ear loses meaning  
 A less powerful cue is Inter-aural Phase Difference (IPD)  
 The time delay causes a phase change.  
 IPD is not consistent, certain angle/frequency combinations will result in no phase shift  
 At low freq (<1-1.5KHz) , wave length larger than the head  
 Then neither ITD or IPD work  
 Hence need one subwoofer in your surround sound system

p13 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
 © Prof Richard Mitchell 2016

## Showing Phase Difference

$$IPD = IATD = T - IATD$$

p14 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
 © Prof Richard Mitchell 2016

## Interaural Intensity Difference (IID)

Sounds originating off to one side of the head must pass through the head to reach the far side  
 This shadowing effect attenuates high frequencies (>4KHz) by up to 30dB  
 Called IID

p15 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
 © Prof Richard Mitchell 2016

## Localisation - Frequency Cues

ITD, IID and IPD do not completely explain the human's sound direction capability  
 For any point in space there exists a conical set of points equidistant from both ears.  
 This is the Cone of Confusion  
 Can be worth tilting your head

p16 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
 © Prof Richard Mitchell 2016

## Localisation - Frequency Cues

Cone of Confusion : ITD gives azimuth not elevation info  
 The pinna (outer ear) has non uniform shape  
 Makes judgment of elevation possible  
 Depending on the direction, different frequencies are attenuated or amplified  
 For a sufficiently complex sound this 'colouring' produces strong elevation cues  
 The interaural distance, head shape and pinna shape make up the Head Related Transfer Function (HRTF)  
 Unique to any person  
 {Can use shape of pinna for id instead of fingerprints}

p17 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
 © Prof Richard Mitchell 2016

## Ear better at sounds from side

p18 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
 © Prof Richard Mitchell 2016

## Localisation - Motion Cues

As with vision, motion parallax v. strong positional cue  
 If sound of long enough duration  
 Listener move head (intentionally or unintentionally)  
 Then ITD and IID info change  
 Can reduce/remove any ambiguity  
 In ideal circumstances all these direction cues combine  
 for an accuracy of about  $1^\circ$  in azimuth (horizontally)  
 and around  $17^\circ$  in elevation

p19 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
 © Prof Richard Mitchell 2016

## Localisation - Range Cues

Like vision, depth perception of sound more difficult  
 Sound intensity reduces with distance  
 due to spreading and attenuation in air  
 but is not a reliable cue  
 (need lot of knowledge about the source)  
 Experience of the frequency components of a familiar  
 sound gives an indication of its distance  
 Again, motion parallax important  
 When head position changes nearby sound sources  
 will change interaural cues more than distant ones

p20 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
 © Prof Richard Mitchell 2016

## Localisation - Environmental Cues

A human can tell by listening  
 Whether in a small room or a large auditorium  
 Whether a sound is coming  
 from round a corner or behind  
 a closed door  
 How? Brain picks up how sound's  
 freq and time characteristics are  
 modified by the environment  
 This is primarily due to reflection  
 and occlusion

p21 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
 © Prof Richard Mitchell 2016

## Localisation - Environmental Cues

Reflections (reverberation) are a function of time  
 The complete audio picture heard by a listener comprises  
 The direct path sound  
 First/early reflections bounced off a obstacle  
 Secondary/Late reflections travelled further  
 Reflections also affected by absorption and diffusion  
 characteristics of the materials they encounter  
 These alter the frequency spectrum

p22 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
 © Prof Richard Mitchell 2016

## Image

[http://www.sae.edu/reference\\_material/audio/pages/Reverb.htm](http://www.sae.edu/reference_material/audio/pages/Reverb.htm)

p23 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
 © Prof Richard Mitchell 2016

## Localisation - Environmental Cues

Occlusions are primarily a function of frequency  
 When an obstacle blocks a direct sound path or one of  
 its reflections higher freq components are attenuated

Exclusions  
 Direct Path clear  
 Reflections muffled

Occlusions  
 Direct Path muffled  
 Reflections muffled

Obstructions  
 Direct Path muffled  
 Reflections clear

p24 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
 © Prof Richard Mitchell 2016

## Spatial Hearing - Knowledge of World

Expectation and familiarity

we perceive sounds to come from places  
where we expect sounds to come from

Visual cues

we perceive sounds to come from sources  
that look like they're making sounds

(exploited by ventriloquists)

Given what we have heard, we now can consider  
how to produce sound for virtual worlds..

p25 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Audio Systems

Sounds are transformed by environment and listener  
(HRTF) before reaching inner ear

Former tells listener about position of source in  
environment and some properties of the environment

From HRTF the listener receives info about the sound  
source's position relative to their head

For VR, 3D audio processing techniques needed so sound  
appears in both correct position and environment type

How these transforms are implemented

closely related to the display type,

two categories: headphones and loudspeakers

p26 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Stereophonic Headphones & HRTFs

The perfect 3D audio system can make a sound appear to  
originate from any direction

Need manipulation of cues humans have learnt for location

One method : provide unique audio image  
to each ear as close as possible to ear canal  
headphones

Then immediate environmental effects  
are removed

Easy to create an artificial soundscape

But, also removed are the cues produced by the HRTF

p27 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Stereophonic Headphones and HRTFs

Recreating interaural time differences is not difficult  
a sound is played in each ear at different times

Recreating the effects of the pinna is much more difficult

Due to the required complexity and high quality of the  
real time frequency transforms

And the fact that everyone's ears are different

An unrealistic HRTF can result in

high front-back confusion and internalisation

(sounds appear very close to or inside the head)

p28 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Making an HRTF

A HRTF can be found in two ways:

Placing small microphones in the ear canal and  
recording the transformation between a tone played at  
a known location and the recording from within the ear

Taking measurements of the pinnae and calculating  
acoustic models

Even though the HRTF should be personalised to get good  
results, this is not practical for general purpose VR

Instead, averaged transforms from multiple humans or  
dummy heads are used

Full HRTFs can also result in distorted sound so simplified  
versions are often used, even less realism

p29 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Measuring the HRTF

p30 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## On Head tracking for VR

Parallax effect very strong cue for auditory localisation.  
Head tracking and updating of listener's position important  
For desktop displays need less: user's head in same direction  
For HMDs and immersive environments, any absence of head tracking  
very noticeable,  
reducing presence  
may cause disorientation.

p31 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Loudspeaker & Multichannel Displays

Alternative to headphones for recreating the full HRTF

Place a number of loudspeakers around the user, utilising at least some of the natural direction cues

Creating a sound which appears to originate from the direction of a physical speaker is very easy

More diff. to create a sound which moves around user does not originate exactly at a physical speaker, a so called 'Phantom Source'

Many techniques for loudspeakers recreating spatial cues  
Cross-talk cancellation, Vector Base Amplitude Panning, Ambisonics and Wave Field Synthesis

p32 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Vector Based Amplitude Panning

Virtual source shares the gain between the nearest speakers to the direction of actual source of user

If a source lies in exactly the same direction as a speaker all the gain will be channelled through it

If the source lies evenly between two speakers half the gain will go to each

Signal well defined as minimum number of speakers used

It is difficult to generate a virtual sound which is perceived very far from a real speaker

Effectiveness related to density /direction of loudspeakers

p33 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Figure

<http://legacy.spa.aalto.fi/research/cat/vbap/>

V. Pulkki "Compensating displacement of amplitude-panned virtual sources." Audio Engineering Society 22th Int. Conf. on Virtual, Synthetic and Entertainment Audio pp. 186-195. 2002 Espoo, Finland

p34 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Cross-Talk Cancellation

With VBAP, Virtual sources appear close to real speakers

Because there are many cues, (ITD and pinna)

These indicate to the listener the sound's origin

Difficult to recreate these cues as both ears receive the output of every speaker - known as cross-talk

If know approx position of listener relative to speakers

Can do cross-talk cancellation

To remove the unwanted signal from one speaker,

add signal 180° out of phase to that of diff speaker

delayed so both signals arrive at ear at same time

Cancellation sets parts of each speaker's output ear gets

p35 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Cross-Talk Cancellation

To create a virtual source, still need artificial HRTF, so limitations described for headphones apply equally here.

Many consumer 3D audio systems use cross-talk cancellation with HRTFs for two speaker configurations but something more like VBAP for rear speakers

p36 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Ambisonics

Ambisonics encodes what the user should hear as  
a sound pressure (W) and  
a set of direction vectors (X, Y, Z) of particle velocity  
In simplest decoding scheme the output of each speaker is  
linear combination of the four channels dependant on the  
position of the speaker in relation to the user  
Most implementations use 8 speakers at corners of a cube  
Generally all speakers are used to localise a sound in any  
direction  
As such spatial definition can be quite low in some cases

p37 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Eight Speakers

p38 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Ambisonics

Unusually the signal is the same irrespective of the  
number of speakers or where they are  
Has picked up some support in computer games (see  
wikipedia for a list)  
Good BBC interview here: <http://www.ambisonic.net/>

University of Reading link: Professor  
Peter Fellgett was part of the group  
who originally developed the theoretical  
framework for Ambisonics

p39 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Wave Field Synthesis, WFS

WFS based on principle that any wave-front can be  
regarded as a superposition of elementary spherical waves  
The ideal implementation is an anechoic room covered with  
a large number of individually driven speakers  
Each speaker reproduces the portion of a wave front that,  
if originating from a specific source, would be passing  
through it at any point in time  
Theoretically a highly realistic sound field could be  
created, but a number of practical restrictions exist:  
Reflection free (anechoic) surfaces  
The density of speakers

p40 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Synthesising a wave front

Multiple speakers synthesising a wave front  
<http://www.iosono-sound.com/technology/wave-field-synthesis>

p41 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Loudspeakers Vs Headphones

Headphones:

- Eliminate actual environmental effects
- Lose actual HRTFs
- Custom HRTFs are inaccurate and can distort sound
- Difficult to get generic HRTFs but time consuming/awkward to generate specific
- Sounds seem closer (internalised)
- Directionality is good

p42 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

### ***Loudspeakers Vs Headphones***

#### Loudspeakers:

Have to deal with actual environment  
Get real HRTF up to a point  
Directionality from physical speakers is very good, i.e.  
sounds from behind very realistic  
Really need speakers from every direction  
If want true phantom sources need to isolate with CC  
filters  
Important part of localisation is parallax, get this well

p43 RJM 08/01/16

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

SE3VR11 - Virtual Reality - Part B  
© Prof Richard Mitchell 2016

## Haptic Perception

What is Haptics?

- Pronunciation: \hap-tik\
- Function: adjective
- Etymology: International Scientific Vocabulary, from Greek *haptesthai* to touch
- 1 : relating to or based on the sense of touch
- 2 : characterized by a predilection for the sense of touch <a haptic person>
- www.merriam-webster.com

p1 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## What is Haptics

"Haptics is now commonly viewed as a perceptual system, mediated by two afferent subsystems, cutaneous and kinesthetic, that most typically involves active manual exploration. Whereas vision and audition are recognized for providing highly precise spatial and temporal information, respectively, the haptic system is especially effective at processing the material characteristics of surfaces and objects."

The haptic system uses sensory information derived from mechanoreceptors and thermoreceptors embedded in the skin ("cutaneous" inputs) together with mechanoreceptors embedded in muscles, tendons, and joints ("kinesthetic" inputs). (Lederman & Klatzky, 2009).

p2 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Touch & Haptics

Touch describes sensations produced when objects come into physical contact with the body.

Tactile sensation originates in the skin  
Small scale surface geometry, pressure, texture, vibration, temperature

Kinaesthetic/Proprioceptive sensation occurs in the muscles, joints and tendons  
Weight, force, stiffness, large scale shape

p3 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Tactile Sensation

p4 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Kinaesthetic ...

p5 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## What is Haptics?

Haptics includes tactile and kinaesthetic sensation  
In Psychology & VR haptics usually refers to Active Touch

For Active Touch to occur changes in touch sensation must correlate with purposeful movement

Using a mouse isn't usually considered haptics even though you can feel it and sense its position

This is because there is no feedback

A haptic device gives touch feedback based on input

p6 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Physiology of Haptics - Tactile

Relies on sensors in and close to the skin

Three types:

- Thermoreceptor (Temperature)  
Measure RATE at which skin temperature changes.  
Two kinds, warm and cold.
- Nociceptor (Pain)  
Don't generally include pain sensation in haptics as is a subjective experience (not referenced to world)  
Usually better to know how to avoid than recreate!
- Mechanoreceptor (Deformation and Vibration)

p7 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Physiology of Haptics - Tactile

Average person has approximately 2m<sup>2</sup> of skin which contains a variety of different receptors

As with the retina in the eye, distribution of receptors is not even.

Denser populations occur where high touch acuity is required (finger tips, lips)

The Sensory Homunculus represents the proportion of brain area devoted to different parts of the skin

p8 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Types of Mechanoreceptor

Glabrous (non-hairy) area of the hand (palm and finger tips) contains four types of mechanoreceptor

40% are Meissner's corpuscles - detect movement across the skin; light touch

25% are Merkel's disks - sustained touch and pressure

13% are Pacinian corpuscles - deeper in skin (dermis); acceleration sensors; most sensitive to vibrations of about 250 Hz

19% are Ruffini corpuscles - detect pressure, skin shear, lateral skin stretch

p9 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Types of Mechanoreceptor

p10 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Properties of Mechanoreceptors

Sensorial Adaption : decrease in electrical response from a receptor over time (for a constant stimulus)

Slowly Adapting (SA) receptors keep firing for a while

Rapidly Adapting (RA) quickly forget and output rapidly decreases

p11 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Comparison of Mechanoreceptors

**Table 3.3** Comparison of various skin mechanoreceptors

| Receptor Type       | Rate of Adaptation | Stimulus frequency (Hz) | Receptive Field     | Function                   |
|---------------------|--------------------|-------------------------|---------------------|----------------------------|
| Merkel Disks        | SA-I               | 0-10                    | Small, well defined | Edges, intensity           |
| Ruffini Corpuscles  | SA-II              | 0-10                    | Large, indistinct   | Static force, skin stretch |
| Meissner Corpuscles | FA-I               | 20-50                   | Small, well defined | Velocity, edges            |
| Pacinian Corpuscles | FA-II              | 100-300                 | Large, indistinct   | Acceleration, vibration    |

Based on Seow [1988], Cholewiak and Collins [1991], and Kalawsky [1993]

p12 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Spatial Resolution

Density and receptive field size affects spatial resolution  
Receptive field size : area of skin which can excite a receptor

If the sensor has a large receptive field - it has low spatial resolution

If the receptive field is small, has high spatial resolution

Varies depending on receptor type and location on the body

p13 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Spatial Resolution

Acuity is measured using the two-point threshold test

Minimum separation between two points of contact that can be achieved before they are perceived as one

From 2mm on the finger pad, 1mm on the palm to 30mm on the forearm and up to 70mm on the back.

Localisation : ability to judge distance between two temporarily separate stimuli ... accuracy up to 0.17mm

p14 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Proprioception & Kinaesthesia

Proprioception is (unconscious) awareness of positions and movements of the body and the amount of force being applied by the muscles from internal mechanisms

Kinaesthesia is often used interchangeably with proprioception but places a stronger emphasis on motion and force and is not purely internal (includes vision)

No distinct line between Proprioception and tactile cues: Judgment of properties such as stiffness come from both.

Without knowledge of limb position and velocity, the output of the mechanoreceptors becomes a jumble of disconnected sensations.

p15 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Proprioception & Kinaesthesia

The sensors for proprioception are in the muscles, tendons and joints

Many of the receptors are the same as those found in the skin such as Ruffini Endings and Pacinian Corpuscles

Give information about joint angles and velocities

Also stretch sensitive receptors connected between tendons and muscles called Golgi Organs

Gogli Organs also activate a 'cut-out' system which protects the muscles from applying excessive damaging force.

p16 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Proprioception & Kinaesthesia

Proprioception has open-loop elements and includes commanded forces in internal model

Measurement of positions, forces and angles is not absolute and can drift. (Floating arms illusion)

Accuracy of angular position decreases with joint size and limb length - about 0.2° at the hip to 0.7° in the metatarsophalangeal joint

The open-loop nature of proprioception can be exploited in touch interface design

p17 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Psychology of Haptics

*'The frequently made suggestions that vision is "more accurate than" or "dominates" touch seem to miss the point. Suggestions of this kind derive from the notion that touch exists only to do what vision can do better. Touch is not simply an inferior form of vision, nor hearing. Touch, as touch, has its own capabilities and limitations.'*

- S. J. Lederman

p18 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Psychology of Haptics

Touch is uniquely different from vision and hearing  
 Many secondary qualities unique to touch (rough, heavy, cold etc.)  
 Perception of sight and sound occurs at a distance, touch requires direct contact  
 Touch is a two way process, touch can alter the environment as well as receiving information about it

p19 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
 © Prof Richard Mitchell 2016

## Form Perception

As with visual shape perception, touch based shape perception is predominantly concerned with finding boundaries  
 but language is in terms of forces and positions.  
 The mechanoreceptors give small scale shape information in terms of lines, edges, and corners etc. which occur as a result of forces deforming certain areas of the skin.  
 The proprioceptive system gives shape on a larger scale by measuring force direction on joints and mapping them to positions in space

p20 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
 © Prof Richard Mitchell 2016

## Exploratory Procedures

Humans use consistent and predictable movements when haptically investigating an object  
 The so called Exploratory procedures (EPs)

p21 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
 © Prof Richard Mitchell 2016

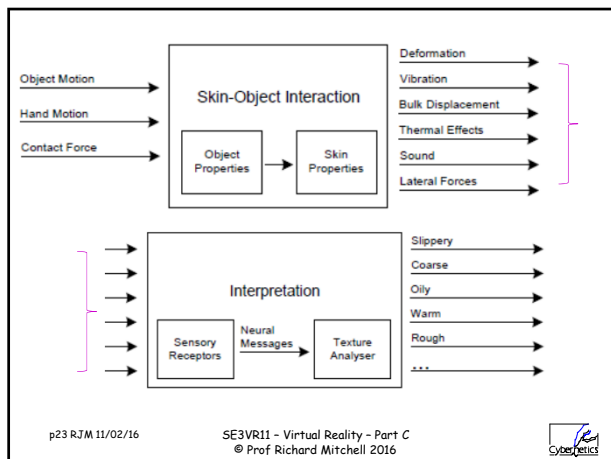

## Texture Perception

Highly complex process, driven by tactile sensors  
 Different sensory channels are fused together to create the experience of texture  
 The complex nature of the process gives rise to a diverse set of perceptual experiences:  
 rough, sharp, cold, sticky, slippery, rubbery, oily and grainy etc.  
 Not only the object's properties affect the output, skin properties such as dryness also have an effect.  
 For example, cold skin makes surfaces seem smoother as the skin's elasticity is reduced

p22 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
 © Prof Richard Mitchell 2016

p23 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
 © Prof Richard Mitchell 2016

## Haptic Display Technologies

We have explored aspects of touch  
 How humans feel the real world  
 Next we consider the technology available for feeling virtual worlds

p24 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
 © Prof Richard Mitchell 2016

## Haptic Displays - Tactile

Temperature, vibration and skin deformation  
Most widely used devices generate vibration (known as vibro-tactile)  
Range from very simple such as mobile phones, to gloves with multiple embedded vibrating units

p25 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Haptic Displays - Tactile

p26 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Glove

**CyberTouch Glove (Virtex):** 6 individually controlled vibrotactile actuators  
0-125 Hz frequency,  
1.2 N amplitude at 125 Hz

p27 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Haptic Displays - Tactile

Devices that work by causing small deformations in the skin are usually based on arrays of mechanical pins which can be moved as required

Challenging - from earlier we know that we need an array with 1mm between pins and bandwidth  $>300\text{Hz}$

Pins are usually actuated by electromagnetic methods: solenoids, voice coils etc. due to the high performance they are capable of (speed and force)

Very difficult to make portable. Generally big and heavy

p28 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Tactile Pin Array - Actuation

| Principle                   | Description   | Comments  |
|-----------------------------|---|---|
| Thermo-electric stimulators | Use shape memory alloys which rapidly change shape on change of temperature | Can exert high forces at large displacements but thermal capacity of material limits frequencies to 10Hz                                |
| Electro-Magnetic            | Use solenoids or small motors   | Such mechanical devices lose performance as their size drops resulting in small forces and low refresh rates.                           |
| Pneumatic                   | Use air pockets or plungers controlled by air valves                        | Can be made small, light weight and flexible (as air source elsewhere). Though compressibility of air limits frequencies to around 10Hz |
| Piezo-electric              | Piezoelectric actuators move lever mechanisms                               | Can display high forces at a wide range of frequencies but lever mechanisms at required density result in large devices.                |

p29 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C

## Haptic displays - Tactile pin arrays

Full display

6\*6 display showing sine wave

p30 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Servo Arrangement

Servos tightly packed for  
2mm pin spacing  
Servo rotates translating  
to vertical movement

Vertical layout of servos  
Six blocks of six servos  
rigidly attached to  
aluminium chassis

p31 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Haptic Displays - Tactile

Stimulator of Tactile Receptors  
by Skin Stretch (STReSS)

Lateral skin deformation (now  
laterotactile stimulation) was first  
described in (Hayward and Cruz-  
Hernandez, 2000).

Travelling wave of lateral skin  
deformation induces sensation of  
moving feature under finger tip.

STReSS is a 2D laterotactile  
display ... stimulates finger tip with  
matrix of piezoelectric actuators

See laterotactile.com

p32 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Haptic Displays - Force Feedback

Devices which provide force back as well as touch  
Used in research since the 60's and available  
commercially for 20 years.  
Until recently, prohibitively expensive and experimental

£100s    £1,000s    £10,000s    £100,000s

p33 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Haptic Displays - Force Feedback

Generally need  
mechanical grounding  
to resist user motion

Exceptions: using  
gyroscopic forces  
or air jets

But limited  
applications

Can be grounded on  
desk, wall, or on user  
body:

p34 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Haptic Displays - Force Feedback

Different ways to compare performance, some are:

Apparent Mass: How much inertia the device has  
(not just weight)

Workspace: How large the interactive area is

Stiffness: How rigid a virtual surface can be  
displayed

Generally speaking can divide force displays into  
back-drivable and admittance controlled

p35 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## FF - Back-drivable devices

Moved by the user

When in "free space" the motors are turned off.

When a virtual surface is contacted the motors  
turn on and resist movement

Designed to be as lightweight as possible

Trade-off is low force and low stiffness

p36 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## FF : Admittance Controlled Devices

Use a force sensor to measure user input and move themselves out of the way.

When in "free space" the motors are running and responding as quickly as possible

When a virtual surface is contacted the motors turn off/resist movement

Designed to be as rigid and high force as possible

Trade-off is high apparent mass and low bandwidth.

p37 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Force Feedback Examples - Gloves

**Pros:**

- Many points of contact
- Lightweight so quick to move
- Very large workspace

**Cons:**

- Limited force direction per contact
- Slow force response
- Low stiffness
- Only basic geometry displayed, no weight or lateral forces (friction)

p38 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Serial Linkage Admittance Controlled

**Pros:**

- High forces
- Low mass and friction for smooth (low bandwidth) movements
- Large workspace
- High stiffness (can exceed human perception of stiffness)

**Cons:**

- Difficult to have multiple points of contact
- Can't make quick (high bandwidth) movements

p39 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Serial Linkage Back-drivable

**Pros:**

- Usually light/low mass
- Moved very quickly
- Simpler to build & control
- Can have multiple contacts each with multiple DoF

**Cons:**

- Small motors and light linkages mean low forces and low stiffness.
- Usually small workspaces

p40 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Parallel Linkage Back-drivable

**Pros:**

- More rigid structure than serial linkage, so higher achievable stiffness
- Also higher force output

**Cons:**

- Small workspaces
- Difficult to have multiple points of contact

p41 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Magnetic levitation

**Pros:**

- High force and high stiffness
- Very low friction

**Cons:**

- Very small workspace
- Difficult to construct and control

p42 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Parallel String/Cable drive (SPIDAR)

### Pros:

Low mass and good workspace  
Cheap/Simple

### Cons:

Low force output  
Can't move too quickly or string gets tangled  
High maintenance

p43 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Degrees of Freedom

The Degrees of Freedom of a robotic device are: "The number of independent linear or rotational movements that completely specify the position and orientation of the whole mechanism"

### In a haptic device:

Active DoF can be controlled by the device itself (usually by motors)  
Passive DOF can be tracked, moved by the user but no forces felt

p44 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Degrees of Freedom

The Human arm has ~ 7 DoF  
A free floating object in space has 6 DoF  
When controllable DOF of a robot = movable DOF it is known as holonomic  
A 6 DOF haptic interface is significantly more mechanically complex and hence expensive  
When are 6 DOF devices necessary?

p45 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Haptic Presentation Properties

Cues provided  
Grounding  
Number of display channels  
Degrees of freedom  
Form  
Fidelity  
Spatial and temporal resolution  
Latency tolerance  
Size/available workspace

p46 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Logistic Properties

user mobility  
interface with tracking methods  
environment requirements  
associability with other sense displays  
portability  
throughput  
encumbrance  
safety  
cost

p47 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Summary Questions

1. A touch screen interface is not usually considered haptic. Why not and what might be added to make it into a haptic device?
2. It is required to design a full body tactile feedback suit. What aspects of the tactile sensory system can be exploited to make the design simpler?
3. A training simulator is to be built to teach astronauts to assemble equipment in zero gravity. A body grounded force feedback glove system is being considered, what are the pros and cons of using this type of device.

p48 RJM 11/02/16

SE3VR11 - Virtual Reality - Part C  
© Prof Richard Mitchell 2016

## Interaction and Input Devices

Interaction and VR

"Interaction with a virtual world is a key ingredient of a VR experience.  
Indeed, if the display of a virtual world does not respond at least to a user's physical movement, then it is not considered virtual reality."

Sherman and Craig, 2003

p1 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Interaction Methods

Should be easy and intuitive  
Are often unnatural (but humans adapt)  
May or may not mimic real life  
Often rely on metaphors and people's familiarity with them

p2 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Interaction Tasks

1. Manipulation

2. Navigation

3. Interacting with others

4. System controls

p3 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## 1. Manipulation

Comprises:  
Selection  
Action  
(and confirmation)

Sometimes selection and action can be rolled into one

p4 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Selection

Selection Technique

Indication of object (methods)  
Confirmation of selection  
Feedback

Some Methods

Virtual hand  
Ray Casting  
Occlusion Techniques  
Extensions

p5 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Selection - Virtual Hands

Method

Users hand maps directly to virtual environment  
Very intuitive as it directly relate to the real world

Limits

Can not reach objects that are far away without moving

p6 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## ***Selection - Ray Casting***

### **Method**

- Laser pointer
- Can be attached directly to the hand
- Collision on nearest object
- Allows selection of distant objects

### **Limits**

- Far away objects can be difficult to select
- Occluded objects can not be selected
- Possibility of traversing all possible selections

p7 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## ***Selection - Occlusion***

Selection is based on occlusion of an object from a users viewpoint

- Vector drawn between eye position and pointing device
- Selection based on collision of vector and object
- Simplifies selection by only using 2 DOF

p8 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## ***Selection - Extensions***

Improves the virtual hand technique

- Allows the user to select objects past their physical reach
- Linear scaling
- Non-linear scaling

p9 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## ***Action***

Actions you might want to perform on a virtual object include moving, scaling, rotating, changing colour...

Some Methods

- Virtual hand
- H.O.M.E.R
- Scaled world grab

p10 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## ***Manipulation - Virtual hand***

Direct mapping between users hand and virtual object

Intuitive object manipulation because it mimics what we do in the real world

p11 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## ***Manipulation - H.O.M.E.R***

Stands for

- Hand centered
- Object
- Manipulation
- Extending
- Ray-casting

"Normal" ray-casting - a light ray extends from the users' hand and the object attaches to the ray

With HOMER, the virtual hand attaches to the object

p12 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Manipulation - Scaled World

The world is scaled to the user instead of hand to object  
Any object - no matter size and distance - can be manipulated using real-world metaphor  
Allows a basic virtual hand manipulation

p13 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Manipulation - World in Miniature WIM

Replica of environment produced in miniature  
Miniature is manipulated and the changes are replicated in the environment  
Allows manipulation of objects out of users physical reach

p14 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## 2. Navigation

**Movement/Travel**  
Moving from one place to another

**Way finding**  
Acquiring and using spatial knowledge  
Knowing where you are relative to where you want to go

p15 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Navigation - Movement

**Types of Movement**

- Exploring - no end goal
- Searching - end goal known
- Manoeuvring - precise movement to position viewpoint

**Methods of Movement**

- Target Selection - Pointing, gaze selection
- Steering - joystick control
- World grab and pull
- Physical locomotion

p16 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Navigation - Way Finding

**Route generation**  
"Move to location"  
Teleportation

**Map generation**  
Target selection  
World in miniature (WIM)  
Zoom back technique

**Things to consider**  
Lack of spatial knowledge can make way finding difficult

p17 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## 3. Interacting with others

Consider the types of interactions in  
Shared versus collaborative environments  
Co-located versus distributed environments

p18 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## 4. System Control

Control over the system running the application is often needed

- Opening / Saving files
- Changing sound volume
- Selecting devices to be used
- Setting visual options
  - Eye separation
  - Draw distances
  - Size of text and objects

p19 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## System Control - Menus

In 2D environments it is common to see WIMP

- Buttons
- Drop down boxes
- Text Boxes
- Tabs
- etc....

2D menus can be adapted for 3D environments

- Advantages as they are recognisable
- Function the same way as on the desktop
- Adapted to run on a tablet

p20 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## System Control - Menus

3D menus or widgets where more exotic looks are created

- Taking advantage of the third dimension
- Menu cubes and ray cast selection
- Created at hand position
- Heads up display

1D Menu

- Dial based selection
- Normally hand rotation

p21 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## System Control - Tool Selectors

Similar to menus

- Enables quick access to specific options
- Options related to current task
- Options used regularly
- Tool belt
- Tool chest or box

p22 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## System Control - Task Tools

Possible tools in an application

- Undo / redo
- Quick save
- Spell check

Related to 3D environments

- Limit motion for manipulation X / Y / Z
- Flashlight
- Shaping / moulding

p23 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Input Devices

p24 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Characteristics

p25 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Desktop Devices

p26 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Desktop Devices - Mice

The standard mouse or trackball:

- Normally 2 DOF
- Active output
- Relative positioning
- Common and recognisable

3D mice or Spaceballs:

- 3 to 6 DOF
- Passive outputs
- Not as commonly known
- Maps well to 3D environments

p27 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Desktop Devices - Force Balls

p28 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Desktop Devices - Joysticks

- Continuous Output
- Return to a default positions
- 2 DOF - but can be more

## Desktop Devices - Keyboards

- Text input is still needed in VR
- Keyboards are Active
- Requires a surface
- Chord keyboard can free keyboard from a surface.

p29 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Chord Keyboards

p30 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Data Gloves

Pinch Sensing  
Gloves

Bend Sensing  
Gloves

p31 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Pinch Sensing Gloves

Made with conductive cloth strips over sections of the gloves

Offers many combinations and gestures

Gestures that do not touch will not work

No accurate representation of the hand position

p32 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Bend Sensing Gloves

Strain gauges

Light based sensors

Multiple sensors on each glove

More accurate representation of hand posture

Gestures possible without touching

p33 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Wired Gloves

PinchGlove

CyberGlove

CyberGrasp

DataGlove

p34 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Direct Human Input

Brain Computer  
Interfacing  
(BCI)

Biosignals

Eye Tracking

Speech

p35 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Brain Computer Interfacing

EEG is a technique for recording brain activity

Record brain activity related to the task

Carry out filtering on the results

Match the results to activates using probabilities

Decide on an outcome

p36 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Other Biosignals

Technology is used in some modern prosthetics and VR flight simulators

- Uses dry electrode arrays
- Sensing muscle nerve signals
- Mapping movements to actions

p37 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Eye/Gaze Tracking

Cameras used to record eyes  
Track pupil location  
Contact lenses have been used  
Results are converted to coordinates and mapped to the environment

p38 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Speech

Speak your intended actions  
Natural way of interacting  
Can interact when hands are occupied

Compromise needed  
Quiet surroundings  
Press to speak  
Key word scheme

p39 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Other Devices

Tablets

PDAs

Custom Made  
Devices

p40 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Tablets & PDAs

High resolution displays  
Easier to read text  
More detail available  
Touch surface and stylus  
Accurate handwriting or drawing  
Gives a physical object to interact with

p41 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Custom Devices

Art application  
Paint brush used for detail  
Bucket used for throwing paint  
(not particularly useful in other applications?)

p42 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Tracking Systems

p43 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Tracking Tech. - Performance Criteria

See criteria from Kalawsky, but consider also:

Degrees of freedom per target

Normally a 3 DoF tracker will measure EITHER position x,y,z OR orientation roll, pitch, yaw (but not both)

-A 6 DoF tracker will measure position and orientation

Number of simultaneous targets

Some tracking system can't track many targets at once

Others must reduce performance for every additional target due to limited bandwidth or similar

Workspace

Some trackers have a fixed maximum workspace, others may lose performance as workspace increases

p44 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Kalawsky - Science of Virtual Reality

**Static accuracy:** The ability of the tracker to determine the coordinates of a position in space. This is the value without averaging or similar filters applied

**Dynamic Accuracy:** The accuracy of the system as the sensor is moved. Highly dependant on the integration period of samples, if a long integration period is used then the dynamic accuracy may be very high

**Latency:** The latency is the time taken to get new data from the sensors including how quickly the sensors respond to changes in position.

p45 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## continued

**Update rate:** The time taken to process the data from the sensors and calculate a position. If running faster than the capture (latency part) it may reuse old data (static accuracy may be high). A high update rate alone isn't necessarily an advantage.

**Phase Lag:** The total time delay of the tracker system, i.e. latency + update rate or the true age of an atom of data as it leaves the tracker system.

**Registration:** The correspondence between actual position and reported position. Basically calibration both initial and over time, drift.

**Signal to noise ratio:** signal relative to background noise.

p46 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Magnetic Tracking

### Method

Two types: AC and DC

Low frequency magnetic field induces currents in the receiver coils

Strength of the signal gives an indication of location and orientation relative to the transmitter

### Information

3 to 6 DOF

Affected by metal in the environment

Normally wired

0.1 inch position accuracy

0.1 degree rotation accuracy

p47 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Magnetic Tracking

### Pros:

Very responsive, low latency

Can track multiple targets though update rate drops (probably up to ~ 10 at once for real time)

### Cons:

Lose accuracy and registration rapidly as working volume increases (S/N ratio drops)

p48 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Inertial Tracking

### Method

- Use multiple inertial sensors
- Gyroscopes (angular measurements)
- Linear accelerometers (linear measurements, angle wrt. gravity)

### Information

Normally only used for orientation not location because of severe error accumulation from noise and drift  
Compass used to compensate gyroscopic drift  
Can be wired and wireless

p49 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Inertial Tracking

### Pros:

- Unlimited working volume
- No line-of-sight issues
- Tilt sensing very accurate
- Highly responsive

### Cons:

Yaw and position has measurement drift. Errors accumulate quickly over time.  
e.g. error of  $0.0098 \text{ m/s}^2$  (1 milli-g). error is double-integrated:  $0.0098 \text{ t}^2/2 = 4.5 \text{ m}$  after 30 s

p50 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Acoustic Tracking

### Method

- High frequency sound emitters
- Microphone receivers
- Distance worked out based on time of flight

### Information

3 to 6 DOF  
Acoustic reflections or noise can reduce accuracy  
Relatively light and inexpensive  
Can be wired and wireless

p51 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Acoustic Tracking

### Pros:

- Good accuracy, responsiveness, robustness and registration (if workspace kept small)
- Can have multiple targets (but at a reduction in update rate)

### Cons:

Occluded sensors have a big impact on performance  
Acoustic properties affected by environment (humidity, temperature, pressure)  
Position accuracy better than orientation

p52 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Optical Tracking

### Method

- Optical sensors
- Measurement of active (LEDs) or passive markers (fiducials, retroreflective markers, natural markers in the environment)

p53 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Optical Tracking

Can be inside-out or outside-in (i.e. receivers are fixed or mobile)

Outside-in has the advantage that a number of cameras can be used to track a single target which increases accuracy and improves line-of-sight

Inside-out has the advantage of being maximally sensitive to orientation

Image processing systems require controlled light conditions

Wireless

p54 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Optical Tracking

### Pros:

- High data rates (much faster than sound), great for real time
- Can be made simply, easy access to technology
- Passive systems very scalable (many targets)

### Cons:

- Line of sight
- Ambient noise (even for IR)
- Non-uniform performance across axes, often depth less accurate (same reason as humans)

p55 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Mechanical Tracking

Includes joystick and mouse (older),  
More usually cables and kinematic links with sensorised joints

### Pros:

- Good accuracy, responsiveness, registration and robustness.
- Very low latency

### Cons:

- Tend to have a limited range of operation. Physical links have a fixed length, cables get tangled if rotated
- Low transparency.

p56 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Sensor Fusion in Trackers

Rarely actually use one technology in isolation  
More common to get information from multiple sources and fuse the data to get a better estimate  
Inertial sensors for orientation are usually combined with a 3 axis magnetometer to adjust for yaw drift  
Inertial sensors for position are very often combined with optical or acoustic sensors to account for drift  
Other sensing technologies are used such as force sensors, bend sensors, capacitance and GPS but normally in combination with the main ones already discussed

p57 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Sensor Fusion in Trackers

e.g. Intersense wand

- Inertial orientation
- Acoustic positioning
- Wired and wireless options
- Integrated joystick
- 4 Buttons

p58 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## Tracking/Input Devices : Wii Remote

Most real trackers like the Wii Remote combine multiple sensing technologies  
Has inertial components

(3-axis accelerometer and 3-axis gyro)

Optical components. High speed cmos camera on the remote (inside looking out) with an IR pass filter detects 4 IR LEDs on the sensor bar

<http://www.youtube.com/watch?v=Jd3-eiid-Uw>

p59 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D  
© Prof Richard Mitchell 2015

## MS Kinect

Wide variety of input types:

gesture, face and speech recognition

Normal camera plus 2 cameras for depth sensing and 4 microphones

Depth sensing works by projecting a pattern on the scene (presumably in IR). Two cameras for depth are sensitive to pattern. Pattern is denser the further away it is

Normal camera + depth sensing used together to isolate individual users and find facial characteristics and gestures

Speech recognition can isolate separate voice commands and select which person is talking

p60 RJM 21/12/15

SE3VR11 - Virtual Reality - Part D

## ***Simulating a virtual world***

This lecture considers two related topics

Physics Engines

Which allows realistic motion of virtual objects

Applies to VR and to Games

We consider kinematic and dynamic motion

We consider timings of the motion

Interaction with Objects

Realistic interaction with bodies

How handle Collision detection and collision response

p1 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## ***On Virtual / Game Physics***

Game physics

computing motion of objects in virtual scene

- including player avatars, NPC's, inanimate objects

computing mechanical interactions of objects

- interaction usually involves contact (collision)

simulation must be real-time (versus high precision simulation for CAD/CAM, etc.)

simulation may be very realistic, approximate, or intentionally distorted (for effect)

p2 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## ***Why it is important***

Can improve immersion

Can support new game play elements

Becoming increasingly prominent (expected) part of high-end games

Like AI and graphics, facilitated by hardware developments (multi-core, GPU)

Physics engine market is becoming more mature

p3 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## ***Physics Engines***

Like games engines, can build your own or use/buy another

If build own

Choose what features you want

Can make application specific optimisations

Can be innovative

But expensive in time to develop

If buy

Have (nominally) a complete solution

Have (hopefully) proven robust code

Features are already defined

Could be expensive - though some are free

p4 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## ***Why Discuss Concepts***

To use a Physics engine effectively,

Best to understand what it is doing

Especially if you need to implement some features

Like owning a car - better if know how works

Topics to be covered

Kinematics and Dynamics

Projectile motion

Collision detection and response

p5 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## ***Kinematics***

How objects move without considering mass/force

Basic quantities

acceleration  $a$ , velocity  $v$ , initial velocity  $u$ , distance  $d$ , and time  $t$

Standard equations

$$d = v t$$

$$v = u + a t$$

$$d = u t + \frac{1}{2} a t^2$$

$$v^2 = u^2 + 2 a d$$

p6 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Example

How high will a ball go if you throw it vertically with initial velocity 5 m/s

$$v^2 = u^2 + 2 a d$$

At top  $v = 0$ , so ...

$$0 = 25 + 2 * -9.8 * d$$

$$\text{So } d = 1.28 \text{ m}$$

Answer independent of mass of ball

p7 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Computing Kinematics in Real Time

```
start = getTime()           // start time
p = 0                       // initial position
u = 10                      // initial velocity
a = -9.8
function update () {       // in render loop
    simulate(getTime() - start);
}
function simulate (t) {
    d = u * t + 0.5 * a * t * t
    move object to p + d
}
```

p8 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Issue

Number of calls and time values used in simulate depend on the frame rate - which may change

For simple problem not too much of an issue

But complex numerical simulations can be sensitive to time steps

(Can get truncation errors and other numerical effects)

Results should be repeatable regardless of host machine

Helps with debugging and better experience of VW

So better to control simulation interval separately

p9 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Frame Rate Independence

```
delta = 0.02               // physics simulation interval (sec)
lag = 0                    // physics lag
updated = 0                // time of last update
function update () {       // in render loop
    now = getTime()
    t = (updated - start) - lag
    lag = lag + (now - updated)
    while ( lag > delta )
        simulate(t)
    t = t + delta
    lag = lag - delta
    updated = now
}
```

p10 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## For 3D

Consider all quantities involving positions to be vectors

Then use normal equations

$$d = v t$$

$$v = u + a t$$

$$d = ut + \frac{1}{2} a t^2$$

eg Projectile ..

$$u = [0, 5, 2]; a = [0, 0, -9.8]$$

Uses scalar products

$$(x_1, y_1, z_1) \cdot (x_2, y_2, z_2) = x_1 x_2 + y_1 y_2 + z_1 z_2$$

p11 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Dynamics

Kinematics does not consider why an object accelerates or why acceleration may change

Proper simulation needs to also include force and mass

Newton's Laws of motion

Body remain at rest, or travel in straight line at a constant speed unless acted on by a force

Acceleration is proportional to resultant force, and in same direction as that force ....

For every action there is an equal and opposite reaction

p12 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Continued

From 2<sup>nd</sup> law: force = mass \* acceleration (f, a vectors)  
 Force → acceleration → change velocity → change position  
 Key point  
 Don't get instantaneous changes in speed and direction  
 Early Pac-Man / Mario style games did  
 Hence in my robot simulations  
 User determines the desired speed  
 New speed = function (current speed, desired speed)

p13 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
 © Prof Richard Mitchell 2016

## How are Forces Applied

Without contact  
 Gravity  
 Wind  
 'magic'  
 Usually though involves contact  
 Collision ... Rebound  
 Includes spring type effects  
 Friction .. Rolling or sliding  
 But detecting when collisions occur is not trivial  
 We will return to that later

p14 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
 © Prof Richard Mitchell 2016

## Physics in VR - Diff Eq

Define relationship between a variable and its differential

Force = mass \* Acceleration

$$F(x(t)) = m \frac{d^2x(t)}{dt^2}$$

Force on object at  
 Pos x at time t

Acc = change of Vel  
 Vel = change of Pos

Once have expression for acceleration, can integrate to  
 get velocity and then again for position  
 Standard methods available for 'numerical' integration

p15 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
 © Prof Richard Mitchell 2016

## Example - Spring

springVec = Mass.pos - Connection.pos  
 Mass.pos = mass.applyForce(-springVec\*spring\_k)

p16 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
 © Prof Richard Mitchell 2016

## Physics Engines

Integrate laws of physics into a game / virtual world  
 Laws are represented by ODE's  
 Physics Engines contain "solvers"  
 Independent of "gameplay"  
 Analogous to how a Game Engine supplies independent  
 "renderers"  
 Usable for a wide number of genres  
 Race simulation, Robotics  
 People jumping, etc

p17 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
 © Prof Richard Mitchell 2016

## Primary Physics Engine Classes

World - also called Physics Space  
 Container for Bodies, Constraints, Collisionshapes,  
 CollisionHandlers and Solvers  
 Body  
 Representing a single body - rigid or soft  
 A character game object usually has multiply body  
 objects  
 Constraint  
 Representing a connection between two bodies

p18 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
 © Prof Richard Mitchell 2016

## Rigid Bodies

Have Fixed Attributes  
Mass, Mass distribution  
And Dynamic Attributes  
Position, Linear/Angular velocity, Orientation

## Constraints / Joints

Enforced relationships between bodies, eg

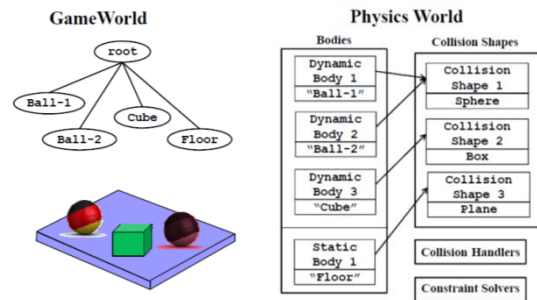

p19 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Physics Space

Adapted from John Clevenger, CSUS

p20 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## On Collisions ..

Re haptics, we interact with a world that pushes back.  
Like the real world, our virtual world can (should?)  
contain objects which move.  
Applies to physically based simulation so virtual objects  
must move under influence of forces  
These objects should never occupy the same space.  
To prevent interpenetration the simulation must:  
Detect when or if interpenetration is about to occur  
(Collision Detection)  
And take the appropriate action to prevent  
interpenetration (Collision Response)

p21 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Collision Detection

Has been defined as:  
"To Automatically report a geometric contact when it  
is about to occur or has actually occurred"  
- M. Lin & S Gottschalk  
Only part of the problem, to take the correct action we  
may also need to know:  
What has collided  
When it first happened  
Where it happened  
How much intersection there is

p22 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Simulation or Coherence - Continuous Collision Detection

In the real world time is continuous, in VR time is discrete  
So if a collision is found it almost definitely occurred prior  
to finding it - Time of Impact problem (TOI)  
Worse, very fast objects may pass through each other in a  
single time step - i.e. no collision will be found  
Different ways of solving the problem, none are perfect:  
Reduce the simulation time step so objects don't move  
faster than their own size in a single step  
Use Ray-Casts or Swept-Volumes to see if the space  
traversed by objects overlaps

p23 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Collision Response

We've found a collision so now what?  
When two objects are detected as colliding or about to  
collide we must take action  
Can't just arbitrarily reposition - would be unrealistic  
and difficult to interact with  
Must make sure objects obey physical laws we expect  
from the real world

p24 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Collision Response - Rigid Bodies?

When objects collide they might  
Bounce (Rigid-body mechanics)  
Deform (soft-body mechanics)  
Break (fracture mechanics)

We will look at rigid bodies, most common and simplest  
For rigid bodies we calculate forces and impulses to  
adjust velocities so objects don't violate physical laws  
Will look at some common techniques and approaches

p25 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Collision Response - Penalty Methods

Don't prevent objects overlapping but try to minimise it  
The 'penalty' is how far into a non-allowable situation we  
have moved and the response is proportional  
Simple version - when objects collide a virtual spring is  
inserted at each contact point to push objects apart  
Nice/simple in theory, in practice difficult to get stable

p26 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Penalty Methods - What's the Problem?

Part of the problem comes from treating all the contact  
points separately  
Systems with more points of contact will be stiffer  
than those with less  
Multiple springs can cancel each other out or setup  
oscillations

Unexpected situations:  
There is no net force on  
the sphere

p27 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Penalty Methods - Discrete Time Problem

Biggest problem due to nature of discrete time simulation  
Consider a ball hitting the ground:  
Ball's collision detected at time step AFTER it has hit  
Then we apply a force to it which slows it down  
As ball goes further below floor spring force increases  
Until the velocity reaches zero and is then reversed  
On way out force applied to ball gradually reduces  
We detect ball has left the ground AFTER it has  
occurred yet we were still applying a force to it  
So - ball leaves with more velocity than when it landed!

p28 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Discrete Time Problem

Extra energy added to collisions creates unstable sims  
More energy is added if the spring force is stiffer or if  
the simulation time step is longer  
i.e. Harder Surface = Stiffer Spring = Bigger error  
Can have soft squishy interaction with low error or more  
rigid contact but more likely to be unstable  
If spring stiffness is low objects can be seen to overlap  
Can get rid of excess energy with friction in the springs  
but more damping creates unrealistic motion  
Simulations need to be 'tuned' to achieve a good response  
- not good for general purpose interaction

p29 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Constraint Methods

So if want no overlap we need an infinitely stiff spring  
which can produce an instantaneous change in velocity  
Such an Impulse creates a change in momentum as a  
force creates a change in acceleration  
To recreate this we calc exact velocity that should occur  
after a collision based on the velocity before  
Using the simple law of elastic collisions we know the  
RELATIVE velocity:  
$$Vel_{after} = e * Vel_{before}$$
  
'e' is the coefficient of restitution ( $-1 < e < 0$ )

p30 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Continued

We must then apply an equal and opposite amount of impulse 'j' to each object

To find this we can setup two simultaneous equations relating the velocity of each object A and B before and after, their masses and applied impulse 'j':

$$V_a^+ = V_a^- + j/M_a; V_b^+ = V_b^- - j/M_b$$

Two equations and two unknowns we can solve them and our objects will separate at the correct speed

This was just linear momentum but angular (rotational) momentum can be calculated in the same way

p31 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Constraint Methods - Problems

What happens if we have resting contact?

Use force and acceleration not impulse and momentum

What if many simultaneous contacts?

To solve more than one point of contact, form a system of non-linear equations that cannot be found analytically

Even small stacks of objects creates very large systems of equations which are extremely complex to solve

Solutions out of scope of this course

p32 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Impacts on VR Design

The more objects that can be put on top of each other the slower the simulation will get

Some solutions are highly accurate

but get exponentially slower with number of contacts

Some solutions are ~linear with the number of contacts

but not so accurate,

things may fall over,

heavy objects can't be put on light objects, etc.

p33 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Impacts on VR Design

For purely graphical realism the quicker solution may be fine, you can't tell if a box is heavy just by looking (primary & secondary qualities)

For a haptic simulation, a more accurate solution is usually required

Limits the number of moving objects you can have

A physics engine for graphics can run at 60Hz

But a physics engine for haptics need to run at 500Hz

p34 RJM 13/03/16

SE3VR11 - Virtual Reality - Simulation  
© Prof Richard Mitchell 2016

## Virtual Reality and Artificial Life

It is possible to develop models for a Virtual World  
Buildings are straightforward, for instance  
Living objects less so  
Then we need to consider behaviour of such objects  
Techniques from artificial life can be relevant  
See for instance Demetri Terzopoulos' 1999 paper  
Artificial Life for Computer Graphics

Also

AI and Artificial Life in Video Games  
by Guy W Lecky-Thompson

p1 RJM 23/3/16

SE3VR11 - Virtual Reality - Part F  
© Prof Richard Mitchell 2016

## Terzopoulos' abstract

"Computer graphics modeling for image synthesis, animation, and virtual reality has advanced dramatically over the past decade, revolutionizing the motion picture, interactive game, and multimedia industries. The field has advanced from First-generation, purely geometric models to more elaborate physics based models. We can now simulate and animate a variety of realworld, physical objects with stunning realism. What's next?"

p2 RJM 23/3/16

SE3VR11 - Virtual Reality - Part F  
© Prof Richard Mitchell 2016

## Lecky-Thompson

AI, or artificial intelligence, builds better games by directing behaviors inside the games that make them more difficult, while artificial life, or A-Life, adds unpredictability of play and a more lifelike environment to games.

AI can be built up in a game by layering behavioral models on static data to produce behavior that is both intelligent and unpredictable.

p3 RJM 23/3/16

SE3VR11 - Virtual Reality - Part F  
© Prof Richard Mitchell 2016

## Animation Modelling Hierarchy

Early breakthrough model geometric and kinematics  
1980s add Physical models  
Now add behaviour / ALife  
Finally add 'intelligent' / AI

p4 RJM 23/3/16

SE3VR11 - Virtual Reality - Part F  
© Prof Richard Mitchell 2016

## Some Concepts

Design of Living Objects

Fractals, L-systems etc

Artificial Evolution

Complex virtual entities created to do tasks

Behaviour of Objects

Flocking and Boids

MASSIVE

p5 RJM 23/3/16

SE3VR11 - Virtual Reality - Part F  
© Prof Richard Mitchell 2016

## Fractals

Complex objects defined by systematically and recursively replacing parts of a simple start object with another, using a simple rule

Simplest : Have initiator and generator, both many lines.

Replace each line in the initiator with the generator shape.

Makes more lines, so replace all these lines with generator

p6 RJM 23/3/16

## Some Natural Examples

Barnsley Fern

Series of dots each  
calculated relative to  
previous ones

p8 RJM 23/3/16

SE3VR11 - Virtual Reality - Part F  
© Prof Richard Mitchell 2016

## Pythagoras Tree

Can also include randomness..

For more sophisticated shapes have formal rules ...

p9 RJM 23/3/16

SE3VR11 - Virtual Reality - Part F  
© Prof Richard Mitchell 2016

## Lindenmayer System (L-Systems)

Mathematical formalism proposed by biologist Aristid Lindenmayer in 1968 : foundation for axiomatic theory of biological development

A Lindenmayer system is a variant of a formal grammar (a set of rules and symbols), acting as a parallel rewriting system

It models the growth processes of plants, organisms and self-similar fractals - due to the recursive nature of the rules.

p10 RJM 23/3/16

SE3VR11 - Virtual Reality - Part F  
© Prof Richard Mitchell 2016

## Examples

Useful: <http://algorithmicbotany.org/papers/#abop>

p11 RJM 23/3/16

SE3VR11 - Virtual Reality - Part F  
© Prof Richard Mitchell 2016

## Details

L-systems are defined as a tuple

$$G = \{V, S, \omega, P\}$$

$V$  (the alphabet) is a set of symbols containing elements that can be replaced (variables)

$S$  is a set of symbols containing elements that remain fixed (constants)

$\omega$  (start, axiom or initiator) is a string of symbols from  $V$  defining the initial state of the system

$P$  is a set of production rules defining the way variables can be replaced (inc constants, variables)

p12 RJM 23/3/16

© Prof Richard Mitchell 2016

## Example

An L-system is an ordered triplet

- $G = \langle V, w, P \rangle$
- $V$  = alphabet of the symbols in the system;  $V = \{F, B\}$
- $w$  = nonempty word, the axiom:  $B$
- $P$  = finite set of production rules (productions)
- $B := F[-B][+B]$
- $F := FF$

## Production Rules for Artificial Plants

Add branching symbols [ ]  
simple example

Main trunk shoots off one side branch

- Angle 45
- Axiom:  $F$
- Seed Cell
- Rule:  $F = F[+F]F$
- Angle

p14 RJM 23/3/16

SE3VR11 - Virtual Reality - Part F  
© Prof Richard Mitchell 2016

## Example

- variables :  $X F$   
constants :  $+ - [ ]$   
start :  $X$   
rules :  $(X \rightarrow F-[[X]+X]+F[+FX]-X), (F \rightarrow FF)$   
angle :  $25^\circ$

Here,  $F$  means "draw forward",  $-$  means "turn left  $25^\circ$ ", and  $+$  means "turn right  $25^\circ$ ".  
 $X$  not drawing action : controls curves' evolution  
[ means save current values which are restored by ]

## Artificial Evolution

Aim to find a solution to a particular problem:

Create a population of individuals to represent potential solutions

Evaluate the individuals

Introduce some selective pressure to promote better individuals (or eliminate lesser quality individuals)

Apply some variation operators to generate new solutions

Repeat

## Karl Sims

Evolution of physically realistic agents  
Have populations comprising different components ...  
They evolve for doing different tasks  
Eg For swimming, Walking, Jumping

## Making Life Realistic

Fractals etc can help make realistic looking images  
But 'life' tends to move and interact  
So want artificial life to also behave realistically  
Need appropriate behaviour, dependent on surroundings  
Of interest is having situations with multiple entities  
Applications  
Film and TV  
Games  
Simulations : engineering, architecture and transport...

## Flocking - Motion

### Collective motion:

Fish in schools, sheep in herds, birds in flocks, lobsters in lines

### Characteristics of animal aggregations:

Distinctive edges  
Freedom to move within own volume  
Coordinated movement

### Benefits of Flocking

Predator protection  
group foraging  
Social advantages - mating

## Craig Reynolds and Boids

<http://cmol.nbi.dk/models/boids/boids.html>

3 rules

### Separation

Steer to avoid crowding with local flock mates.

p25 RJM 23/3/16

### Alignment

Steer toward the average heading of local flock mates.

SE3VR11 - Virtual Reality - Part F  
© Prof Richard Mitchell 2016

### Cohesion

Steer to move toward average position of local flock mates.

## Craig Reynolds & "boids"

Each boid has direct access to whole scene's geometric description  
For Flocking react only to flockmates within its small neighborhood.

Neighbourhood = model of limited perception / region where flockmates influence steering

**distance**, measured from the center of the boid

**angle**, measured from boid's direction of flight

Flockmates outside local neighborhood ignored

## MASSIVE

Software package by Stephen Regelous for visual effects

Key feature : can create 1000s ...1000000s of agents

Fuzzy logic used so each agent react individually to surroundings

Used to control prerecorded animation clips

(say from motion capture or hand animation)

Creates characters that move, act and react realistically

Developed initially for Lord of the Rings ...

Used in Avatar, King Kong, Narnia, I Robot, Doctor Who

## Summary

Artificial Life / Intelligence have their place in Virtual Worlds/ computer games

Plenty of techniques available - an overview given here of some of the concepts.

## Where will VR take you

3 april 1016 issue of the IET's E&T Magazine

<http://eandt.theiet.org/magazine/2016/03/virtual-reality-introduction.cfm?origin=EtOtherStories>

2016 may be the year that virtual reality (VR) technology breaks into the mainstream. Hardware manufacturers like Oculus are gearing up, with the first Rift headsets reaching customers at the end of March and many people lining up to experience different 'realities'
